

## **DECLARATION BY THE CANDIDATE**

We hereby declare that the project report entitled “ **ATTENDANCE SYSTEM USING FACE RECOGNITION**” submitted by us to **GeeksforGeeks** in partial fulfilment of the requirement for the award of the Certificate of Participate BCA and MCA in Bachelor and Master of COMPUTER APPLICATIONS, from Department of FACULTY OF COMPUTER SCIENCES AND APPLICATIONS, CMPICA is a record of project Solving for India . We further declare that the work carried out and documented in this project report has not been submitted anywhere else either in part or in full and it is the original work, for the award of any other degree or diploma in this institute or any other institute or university.

## ACKNOWLEDGEMENT

We, the developer of the Project "" **ATTENDANCE SYSTEM USING FACE RECOGNITION** with immense pleasure and commitment would like to present the internship project assignment. The development of this project has given me wide opportunity to think, implement and interact with various aspects of management skills as well as the new emerging technologies. Every work that one completes successfully stands on the constant encouragement, good will and support of the people around. I hereby avail this opportunity to express my gratitude to number of people who extended their valuable time, full support and cooperation in developing the project.

We express deep sense of gratitude towards our Principal of CMPICA , Dr.Dharmendra Patel and Head of the of FACULTY OF COMPUTER SCIENCES AND APPLICATIONS Dr.Sanskriti Patel for the support during the of study and development. It is because of them, that we were prompted to do hard work, adopting new technologies.

**Thanks,**

**20BCA025 KEYUR KACHHADIYA**

**22MCA122 ARJUN PODUVAL**

## **Abstract**

This project involves building an attendance system which utilizes facial recognition to mark the presence, time-in, and time-out of Users. It covers areas such as facial detection, alignment, and recognition, along with the development of a web application to cater to various use cases of the system such as registration of new Users, addition of photos to the training dataset, viewing attendance reports, etc. This project intends to serve as an efficient substitute for traditional manual attendance systems. It can be used in corporate offices, schools, and organizations where security is essential.

## **Purpose**

The purpose of this document is to specify software requirements of the Attendance Management System Using Face Recognition. It is intended to be a complete specification of what functionality the Attendance Management System provides.

Furthermore, this project aims to automate the traditional attendance system where the attendance is marked manually. It also enables an organization to maintain its records like in-time, out time, break time and attendance digitally. Digitalization of the system would also help in better visualization of the data using graphs to display the no. of Users present today, total work hours of each User and their break time. Its added features serve as an efficient upgrade and replacement over the traditional attendance system.

## **Scope**

Facial recognition is becoming more prominent in our society. It has made major progress in the field of security. It is a very effective tool that can help law enforcers to recognize criminals and software companies are leveraging the technology to help users access the technology. This technology can be further developed to be used in other avenues such as ATMs, accessing confidential files, or other sensitive materials.

This project serves as a foundation for future projects based on facial detection and recognition. This project also covers web development and database management with a user-friendly UI. Using this system any corporate offices, school and organization can replace their traditional way of maintaining attendance of the Users and can also generate their availability(presence) report throughout the month.

## **Introduction**

### **- Brief Introduction**

This project aims to automate the traditional attendance system where the attendance is marked manually. It also enables an organization to maintain its records like in-time, out time, break time and attendance digitally. Digitalization of the system would also help in better visualization of the data using graphs to display the no. of Users present today, total work hours of each User and their break time. Its added features serve as an efficient upgrade and replacement over the traditional attendance system.

### **- Technology/Platform/Tools used**

#### **Technology:**

- Django
- OpenCV
- Dlib
- Open-Source Face Recognition Library
- Dataset of image .
- HTML, CSS, JavaScript
- Bootstrap

#### **Platform:**

- Windows

#### **Tools:**

- PyCharm

## **Software Requirements Specification - SRS**

We have 2 types of users of the system.

1. User
2. Admin

Following functionalities can be performed by the admin:

- Login
- Register new User to the system
- Add User photos to the training data set
- Train the model
- View attendance report of all Users. Attendance can be filtered by date or User.

Following functionalities can be performed by the User:

- Login
- Mark his/her time-in and time-out by scanning their face
- View attendance report of self

## **Functional Requirements**

### **1.1 Manage Registration and Login**

#### **1.1.1 Register new User**

Description: Admin can register new

Input: User Details

Output: success message displaying the user has been created.

#### **1.1.2 Log-In to the system**

Input: User credentials

Output: If the credentials are correct, user will be redirected to the dashboard of the system

Exception Flow: If the entered credentials are incorrect then user will be redirected to the login page again displaying an error message.

### **1.2 Manage Attendance Details**

#### **1.2.1 Mark your attendance-in**

Input: User will scan his/her face using the external web camera.

Output: system will identify the user uniquely and will mark his/her in-time to the database. The same success message will be transmitted to the user.

#### **1.2.2 Mark your attendance-out**

Input: User will scan his/her face using the external web camera.

Output: system will identify the user uniquely and will mark his/her out-time to the database. The same success message will be transmitted to the user.

### **1.2.3 View my attendance report**

Description: User may often need to see his / her attendance record throughout the month or year. Using this feature one can see his / her attendance record till the date.

Input: User selection

Output: Statistical analytics of the particular User who is currently logged into the system will be displayed.

### **1.2.4 View User's attendance report**

Description: This feature is for admin. Admin can monitor the availability of each User till the date. i.e., how many Users are present today out of total Users etc. can be monitored.

Input: user selection

Output: Attendance record of each User including how many Users are present today out of total along with the availability graph.

## **1.3 Manage User Details**

### **1.3.1 Add photo of the User**

Description: Admin only can access this feature. Admin can add a photo of a User during the registration process.

Input: Username of a User

Output: Success message record has been added.

Process: System will process an image and will generate necessary system data to identify each User uniquely.

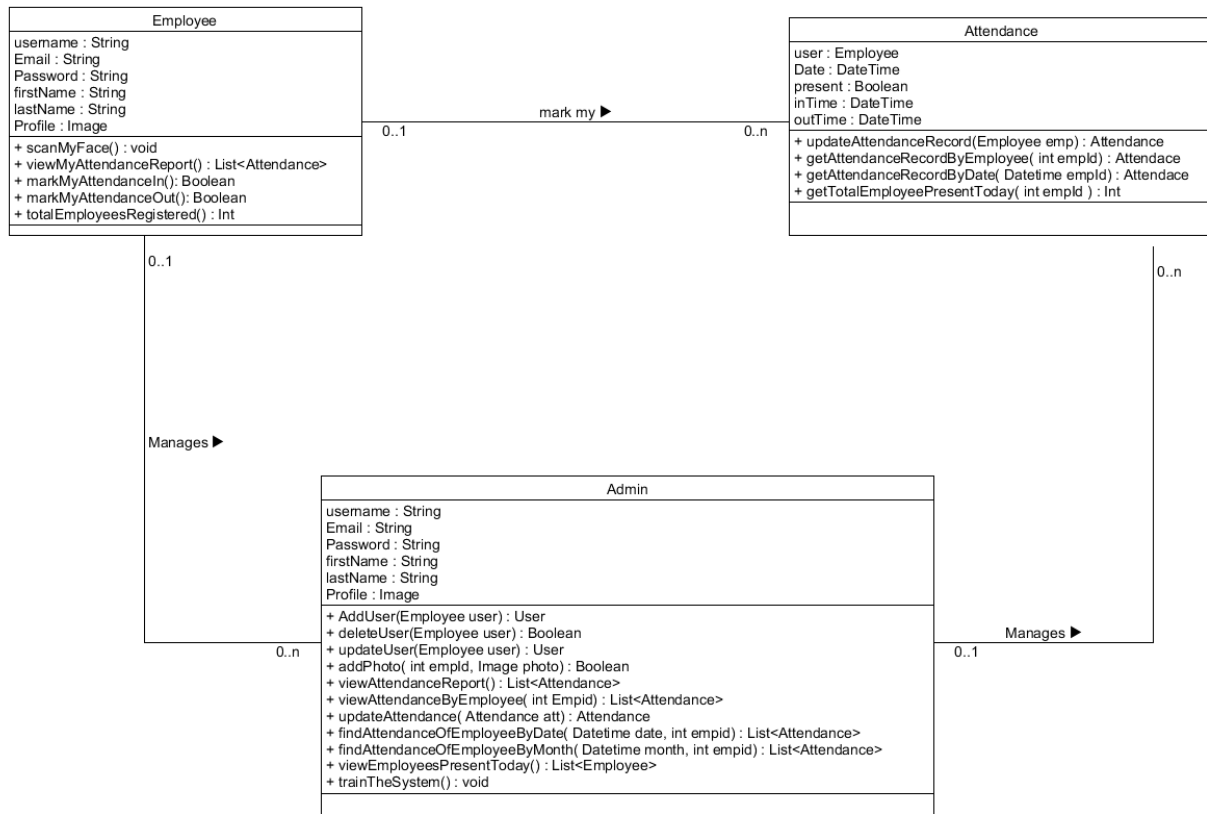

### **1.3.2 Analyze the User Details**

Input: user selection

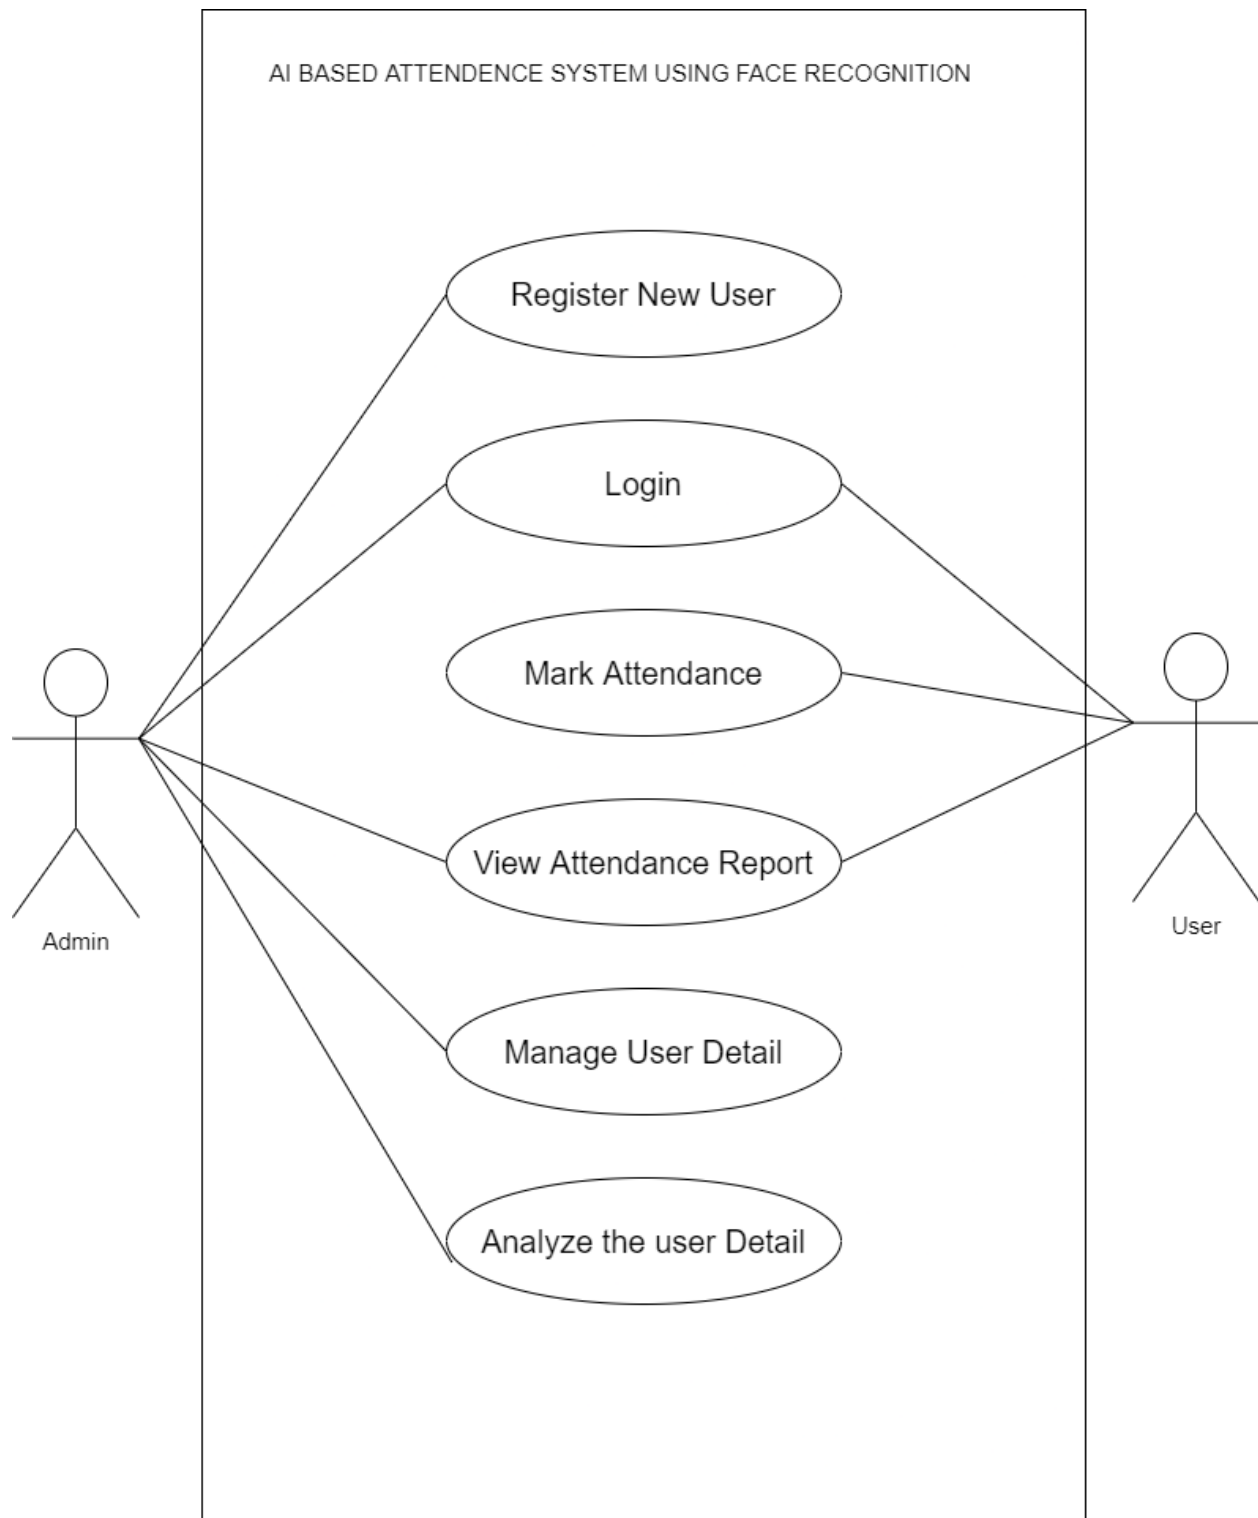

Output: system will process all the available records of the Users and will generate necessary system data to identify each User uniquely.

## Class Diagram

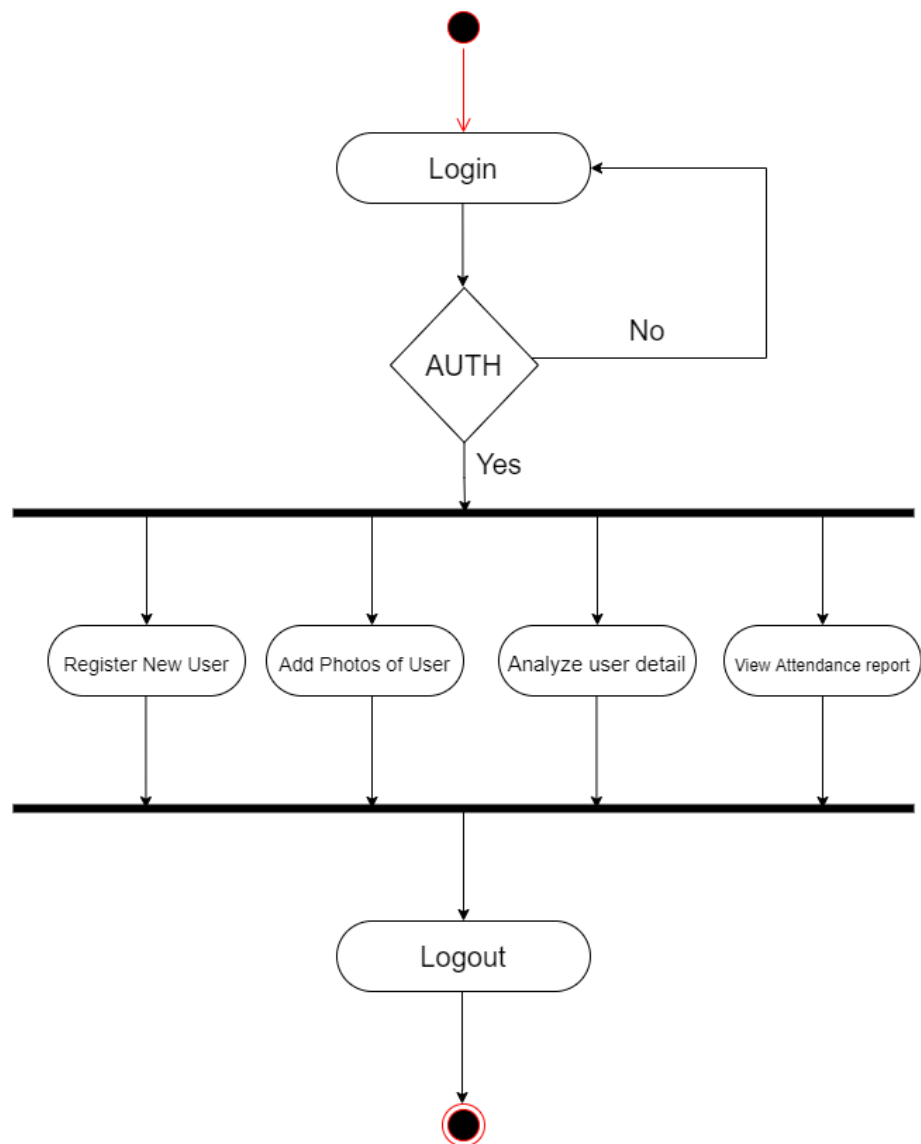

## Use case Diagram

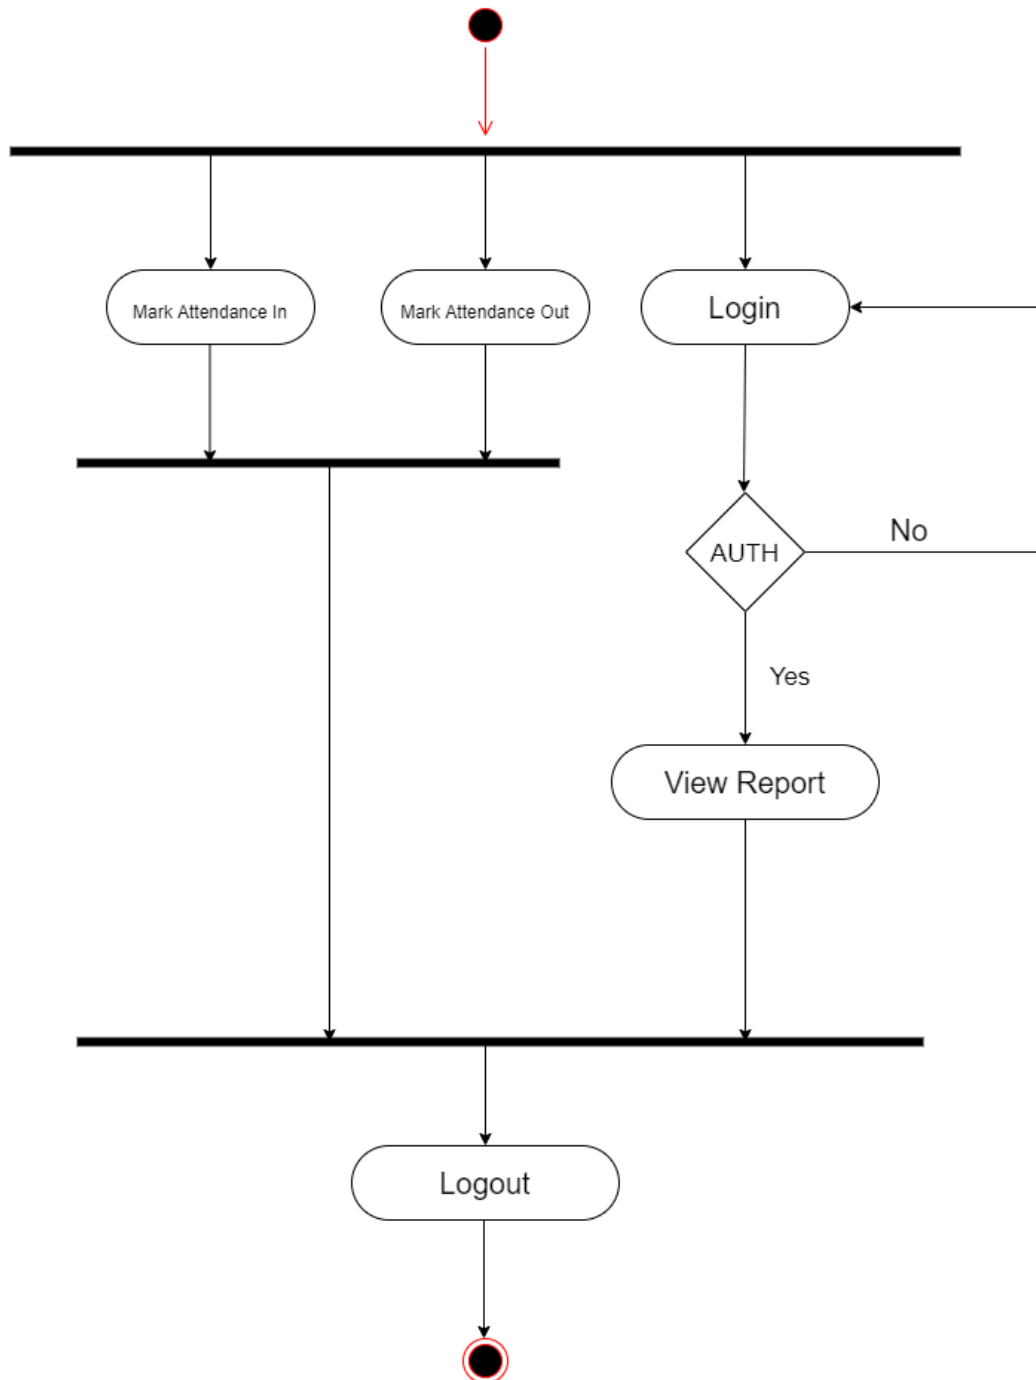

## Activity Diagram

Admin Activity Diagram

## User Activity Diagram

## Data Dictionary

### User

No	Field name	Data type	Required	Unique	PK / FK	Ref. Table
1	UserId	int	true	true	PK	-
2	Email	string	true	true	-	-
3	Name	string	true	false	-	-
4	Password	string	true	false	-	-
5	CreatedAt	Datetime	true	false	-	-

### Present

No	Field name	Data type	Required	Unique	PK / FK	Ref. Table
1	PIId	int	true	true	PK	-
2	Date	Datetime	True	False	-	-
3	User	User	True	False	FK	Users
4	Present	Boolean	True	False	-	-

## Time

No	Field name	Data type	Required	Unique	PK / FK	Ref. Table
1	TId	int	true	true	PK	-
2	Date	Datetime	true	True	-	-
3	User	Users	True	False	FK	Users
4	Time	Datetime	False	False	-	-

## **Implementation Details**

### **Modules**

The features of the system are mainly divided into 3 modules.

#### **Registration and Login Module**

This module mainly deals with the functionalities related to the registration of any new User to the organization, Log into the system and managing User's profile details. Using features provided by this module admin can register new User to the system and admin / User both can log into the system using their credentials.

#### **Manage Attendance Details**

This module mainly deals with the features related to the User's attendance. Using this User can mark their presence, time-in and time-out in the system. Admin can see the availability report of each User, User can see his/her attendance report along with some possible filters such as filter by User and filter by date.

#### **Manage User Details**

This module mainly deals with the features related to the User's profile. Using this admin can add a photo of the newly registered User during registration. Admin can also command the system explicitly to train the model and system will make necessary calculation and will generate some data which will be used internally to identify each User uniquely.

## Function prototypes which implement major functionality

- `List<Attendance> viewMyAttendanceReport(int empId);`
- `Int totalUsersRegistered();`
- `List<Attendance> getAttendanceRecordByUser(int empId);`
- `Boolean updateAttendanceRecord(int empId, Attendance update);`
- `Boolean registerUser(User new_User);`
- `Boolean addPhoto( int empId, string photo);`

## Testing

Unit testing of each module was done after successfully completing the module. Each module was tested individually before integrating them with the whole system.

After integrating each module with the system, integration testing was done in order to check if modules are working properly together.

After completing all integrations, black-box testing of the whole system was carried out to ensure the system works in a correct manner.

### Black box testing of Major functions of the system

#### 1. Log in to the system.

**Case 1:** Invalid Username or password entered by the user.

**Output:** Error message on the screen saying “Invalid credentials”

**Case 2:** Valid credentials.

**Output:** The user is redirected to the Dashboard page.

## 2. Update Profile

**Case 1:** username already exists.

**Output:** Error message on the screen saying “Username already exists”

**Case 2:** Some of required fields missing in input.

**Output:** Model validation errors will be displayed to the user.

**Case 3:** All input data are valid.

**Output:** Profile updated successfully.

## 3. View Attendance.

**Case 1:** User is not logged in.

**Output:** Redirected to the login page with error message “Please login!”.

**Case 2:** If a user exists and has the attendance records.

**Output:** All the chat history will be displayed

**Case 4:** Provided username does not exist in the system.

**Output:** 404 Error.

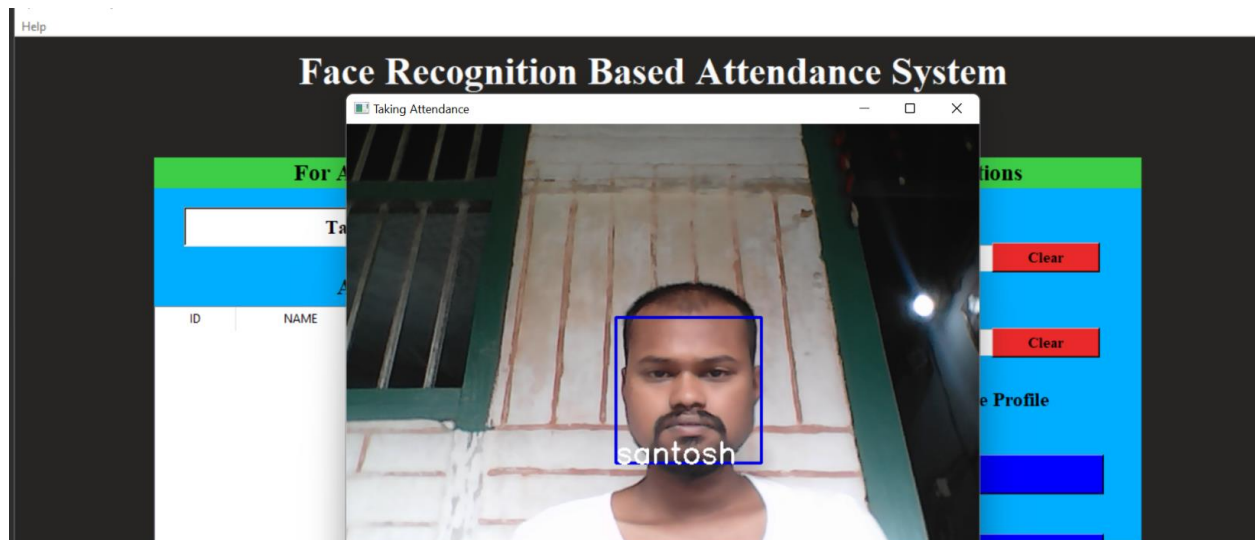

## Screenshots

Login

**Mark my attendance In / Out**

**Scanning Face**

**View Attendance Records by Admin**

## Add Photos

## User Dashboard

## **View My Attendance by User**

**Admin can filter attendance by User / by date**

### 3.1 Roles and Responsibilities:

Name	Planning	Data Cleaning	Model Development	GUI Integration	Testing	Documentation
Keyur	✓		✓	✓	✓	✓
Dhruv	✓	✓	✓	✓		
Manush	✓	✓	✓		✓	✓
Arjun	✓	✓		✓		

### View Report from User Side

The screenshot displays the 'Attendance System' application window. The title bar shows 'Attendance System' with standard window controls. A menu bar includes 'Help', 'Change Password', 'Contact Us', and 'Exit'. The main content area has a dark background with the title 'Face Recognition Based Attendance System' and a timestamp '24-October-2021 | 09:09:10'. The interface is divided into two main sections: 'For Already Registered' and 'For New Registrations'. The 'For Already Registered' section features a yellow 'Take Attendance' button, an 'Attendance' table with columns for ID, NAME, DATE, and TIME, and a red 'Quit' button at the bottom. The 'For New Registrations' section includes input fields for 'Enter ID' and 'Enter Name', each with a 'Clear' button, a sequence of steps '1)Take Images >>> 2)Save Profile', 'Take Images' and 'Save Profile' buttons, and a status message 'Total Registrations till now : 1'.

## **Conclusion**

### **Functionalities implemented successfully:**

- Registration
- Login / Logout
- Manage User Profile
- Update user profile
- View My Attendance
- View Attendance by Date
- View Attendance by User
- Manage Attendance
- Mark my attendance In
- Mark my attendance Out

- Add photos
- Add new User
- Train the system
- View Attendance record by date
- View no. of User present today
- View Total number of Users

## **Limitation and Future Extensions**

### **● Limitations**

- Attendance can be marked if the picture of an User is shown
- 20 images of each User are taken for better accuracy. 300 Images per User in a larger organization would consume a massive volume to store the images.
- The training time for our classifier takes about 20 seconds for each person. Hence for a large number of Users, it would take a very long time to train. Though training the classifier isn't something that needs to be frequently done, but it would be better if a classifier taking lesser time while maintaining the accuracy can be built.
- The current model is 99.38% Accurate

### **● Functionalities not implemented**

- Alert System
- Forgot Password
- Email Notifications

### **● Possible future extensions**

- A feature which can give intruder alert can be included in the system. Furthermore, the images of unknown people can be saved in an efficient manner and displayed in the system for better security.
- The number of training images can be reduced so that less storage is required. This can be done by removing duplicate images of the same person, or images with similar embeddings.
- The training time can be reduced by retraining the classifier only for the newly added images.

- A feature can be added where an User is automatically sent a warning if his attendance or working hours are below the threshold.
- Wrongly classified images can be added to the training dataset with the correct label so as to increase the accuracy of the recognition model.
